

“Man made Climate Change is a Fraud”

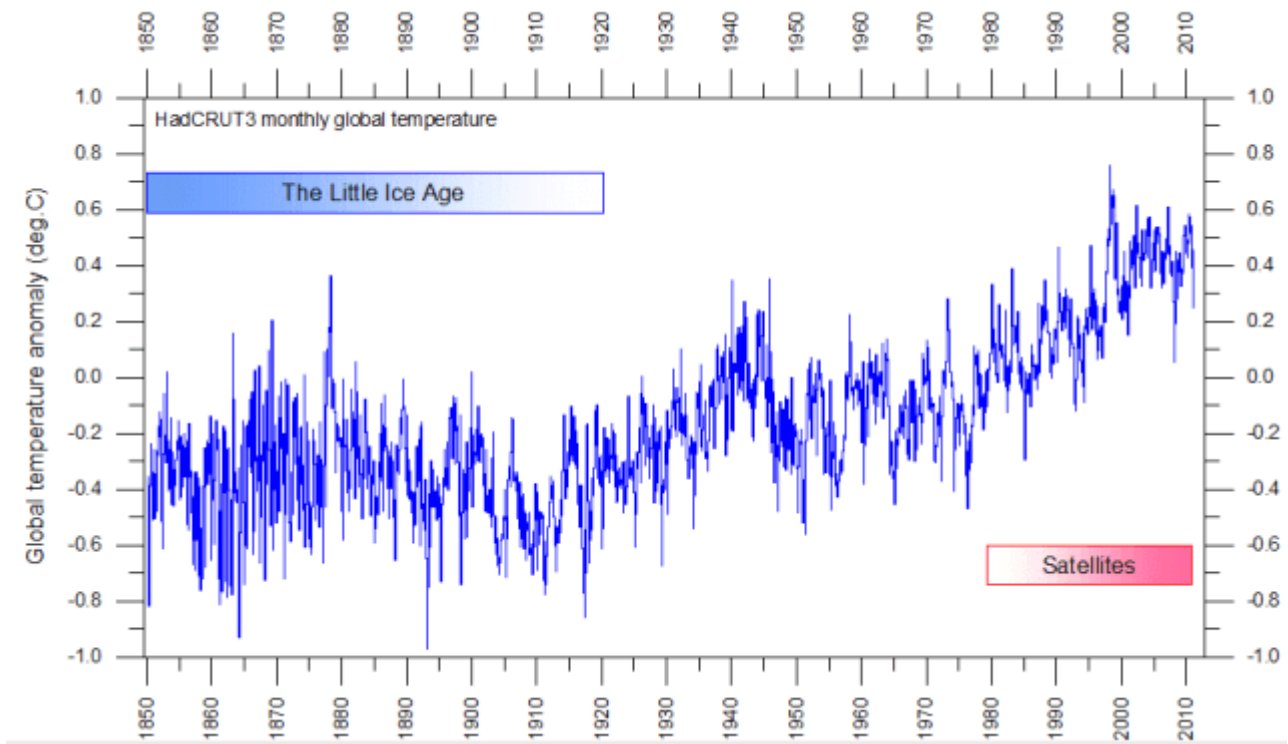

450.000 years ago the world's atmosphere contained 10 times more CO2 than today – and this was during an ice age.

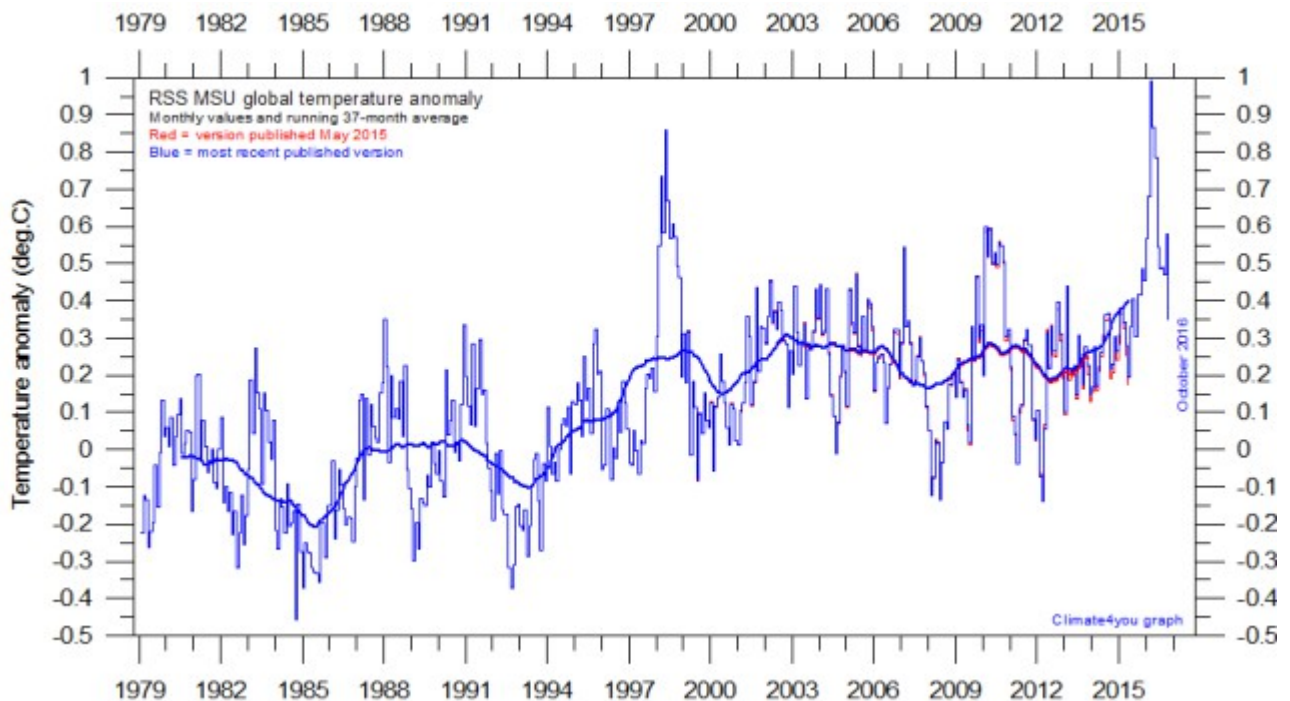

*

The following graphs originate from “Climate for you” by Prof. Humlum (see also <http://www.climate4you.com/Climate4You>) – unless other sources are stated.

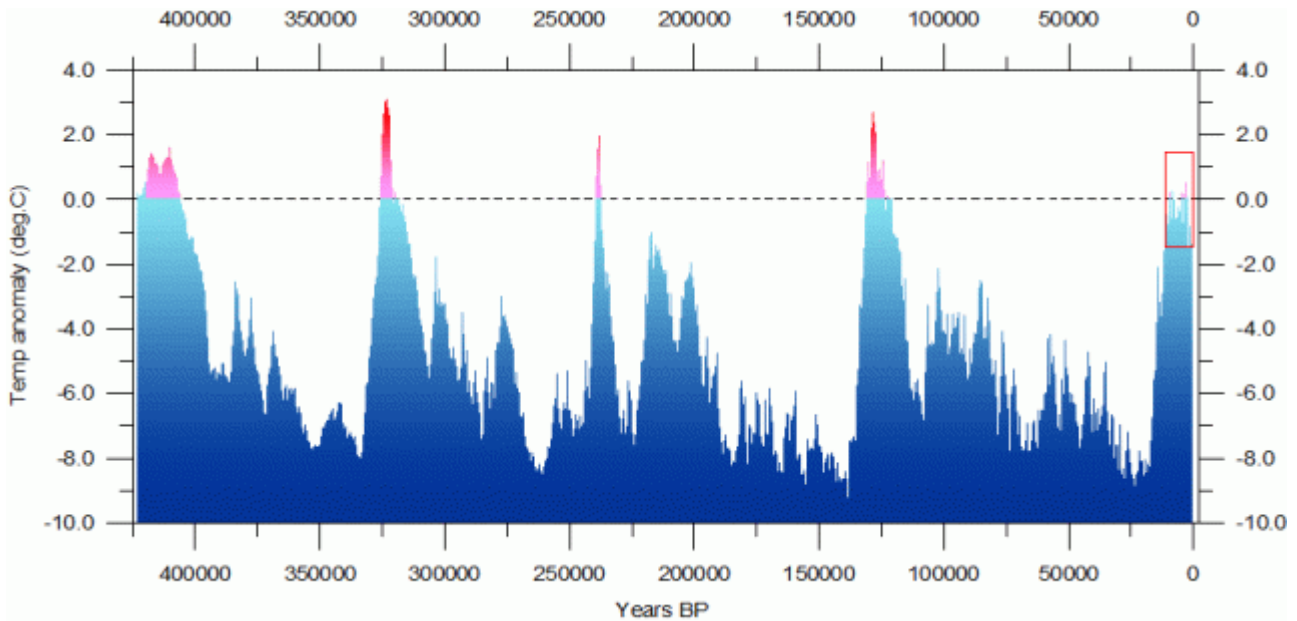

Below: Fortunately the Global Average Temperature has increased since the end of the “Little Ice Age” (1500-1850 AD) by 0.7 °C. Before this it has been much warmer:

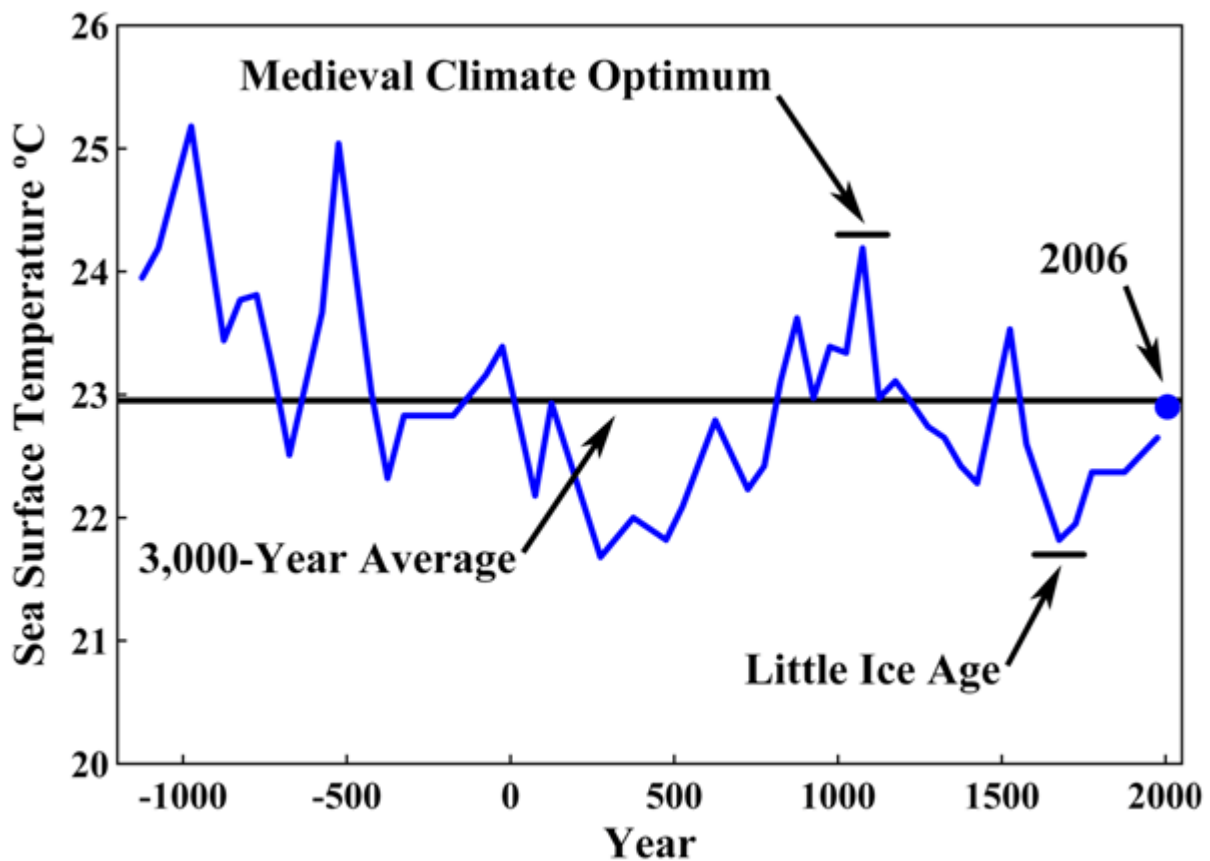

Below: Since 1940 the temperature has risen by 0.4°C. The year 2016 was, exactly like 1998, an “El Niño”-year with high temperatures which have nothing to do with any climate changes.

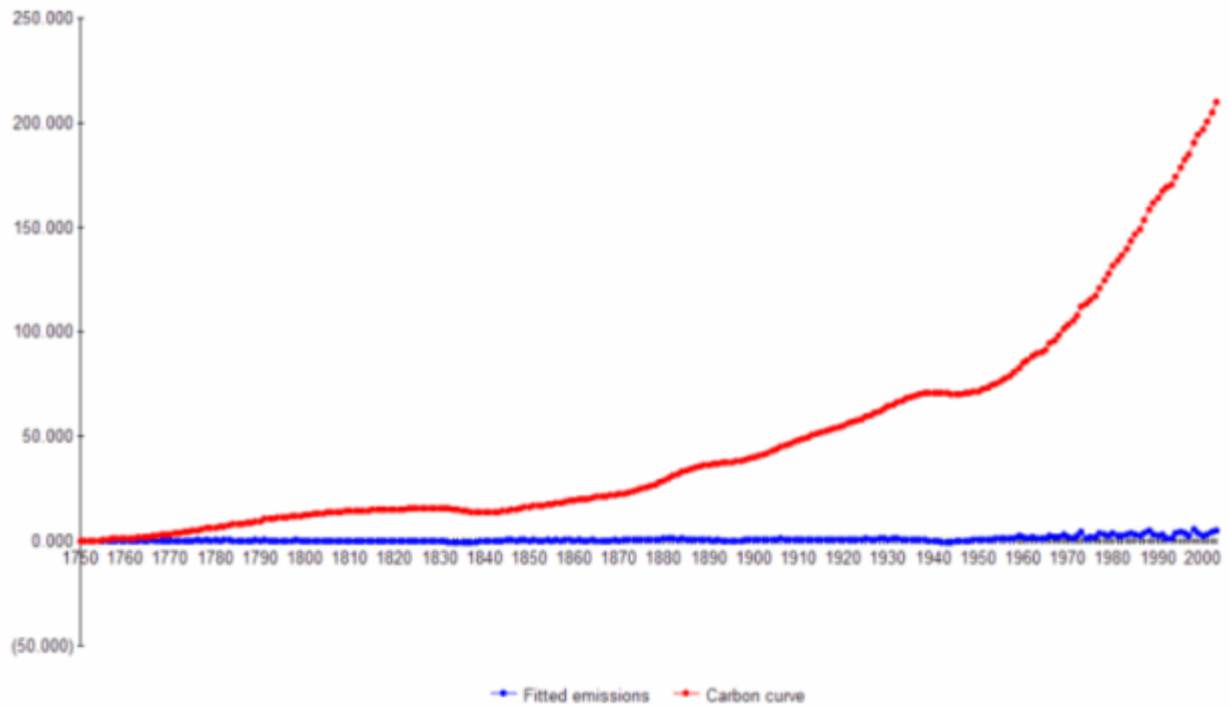

Below: Data from Vladivostok Ice core show the natural global temperature anomalies during the last 400,000 years:

The chart below shows the average global temperatures of the last 3,000 years, based on researches in the Sargasso Sea. Consider the warm periods between 1,000 and 500 BC as well as between 800 and 1,500 AD. These reflect temperatures we haven't reached yet. These periods were not at all man made but have to be attributed to fluctuations of the sun's activity.

Below: only 1% of the atmospheric CO₂ (red line) originates from human activities.

The graph below shows that atmospherical CO₂ increases – but not the temperatures. This indicates that CO₂ doesn't cause Global Warming, but that it is set free from the oceans by warming up of the atmosphere..

Temperature records versus atmospheric CO₂
